To the veterinarian, the perfect image is one that offers adequate detail to see pathology when pathology exists and be able to produce the same level of image detail every day.

Metron produces the perfect image by mastering the many factors that typically hinder image quality.

Technique and
Image Quality Standards

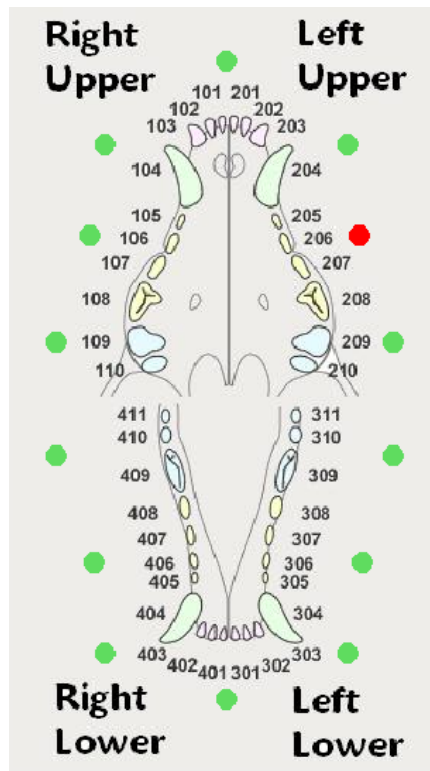

Metron uniquely incorporates dental digital x-ray to help produce that perfect image. In Companion Animal Dental, the image result is impacted by the following factors:

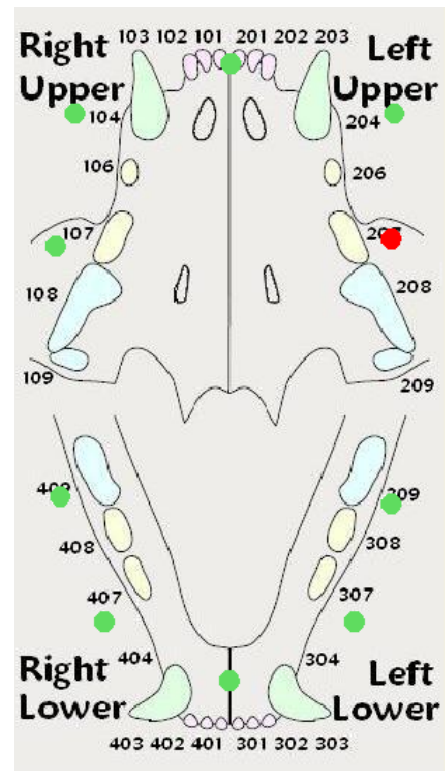

1. Dental x-ray generator
2. Distance from plane of interest
3. Thickness and density of the object of interest
4. X-ray plate type and current condition
5. X-ray technique
6. Custom x-ray scan settings including resolution and filtering
7. Image quality management

With most dental x-ray systems, yielding the “perfect” x-ray is simply not possible. Metron changes all of that. Although “perfect” may be impossible. As the practitioner, you need to trust your tools to help you diagnose. The inventory of x-ray images that follow have been produced by equine veterinarians throughout the world using Metron and our unique approach to “image quality management.”

These images have been created in production and have not been modified from their original form.
